- Created for the robot-automotive field.
- Exploiting multi-stage ejector technology with low compressed air consumption.
- High performance in relation to compact size:
  - Induced vacuum air flow from 3.5 to 14 cum/h, 85% vacuum.
- Exceptional modularity: combination of 1 to 6 modules of different capacity, with built-in compressed air supply manifold.
- Filter and all sensitive parts designed for ease of inspection.

- **Standard features:**
  - Two micro solenoid valves for the compressed air supply to the generator and the compressed air blow off/ejection.
  - A vacuum switch with double digital output and display.
  - An integrated flow regulator for the compressed air blow off/ejection.
  - A transparent manifold in Plexiglas or aluminium, with three filtered suction connections.
- **Optional features:**
  - Metal support bracket for attaching to the machinery.
  - Set of pre-wired cables with built-in energy saving device.
